	Immunoglobulin M (IgM) normally constitutes about 10% of serum immunoglobulins.	
	IgM antibody is prominent in early immune responses to most antigens and is largely	
	confined to plasma due to it's large size. Monomeric IgM is expressed as a membrane	
	bound antibody on the surface of B cells and as a pentamer when secreted by plasma

	efficient than IgG in activiating the complement pathway. The gene for the mu constant	
	region contains four domains separated by short intervening sequences.
