| Product Detail: | The cathepsin family of proteolytic enzymes contains several diverse classes of |
| | proteases. The cysteine protease class comprises cathepsins B, L, H, K, S, and O. The |
| | aspartyl protease class is composed of cathepsins D and E. Cathepsin G is in the serine |
| | protease class. Most cathepsins are lysosomal and each is involved in various cellular |
| | events such as peptide biosynthesis and protein degradation. The propeptide region of |

cathepsin H is highly homologous to other cathepsins. This region is thought to play a role in the processing of cysteine proteases. Cathepsin H is thought to be involved in several pathological conditions, including neuro degenerative disorders and cancer.

Function:

Important for the overall degradation of proteins in lysosomes.

Subunit:

Composed of a mini chain and a large chain. The large chain may be split into heavy and light chain. All chains are held together by disulfide bonds.

Subcellular Location:

Lysosome.

Similarity:

diojojech.com Belongs to the peptidase C1 family.
