Product Detail:	Olfactory receptors interact with odorant molecules in the nose, to initiate a neuronal
	response that triggers the perception of a smell. The olfactory receptor proteins are
	members of a large family of G-protein-coupled receptors (GPCR) arising from single
	coding-exon genes. Olfactory receptors share a 7-transmembrane domain structure with
	many neurotransmitter and hormone receptors and are responsible for the recognition

and G protein-mediated transduction of odorant signals. The olfactory receptor gene family is the largest in the genome. The nomenclature assigned to the olfactory receptor genes and proteins for this organism is independent of other organisms. [provided by RefSeq, Jul 2008]
