Product Detail:	Interleukin 6 (IL6) is a potent pleiotropic cytokine that regulates cell growth and differentiation and plays an important role in immune response. The protein encoded by this gene is a subunit of the receptor complex for IL6. The IL6 receptor is a protein

complex consisting of this protein and interleukin 6 signal transducer (IL6ST/GP130/IL6-beta), a receptor subunit also shared by many other cytokines. Dysregulated production of IL6 and this receptor are implicated in the pathogenesis of many diseases, such as multiple myeloma, autoimmune diseases and prostate cancer. Alternatively spliced transcript variants encoding distinct isoforms have been reported. [provided by RefSeq].

Function:

Part of the receptor for interleukin 6. Binds to IL6 with low affinity, but does not transduce a signal. Signal activation necessitate an association with IL6ST. Activation may lead to the regulation of the immune response, acute-phase reactions and hematopoiesis.

Low concentration of a soluble form of IL6 receptor acts as an agonist of IL6 activity.

Subunit:

Hexamer of two molecules each of IL6, IL6R and IL6ST.

Subcellular Location:

Isoform 1: Basolateral cell membrane; Single-pass type I membrane protein. Isoform 2: Secreted.

Tissue Specificity:

Isoform 2 is expressed in peripheral blood mononuclear cells and weakly found in urine and serum.

Post-translational modifications:

A short soluble form may also be released from the membrane by proteolysis.

Similarity:

Belongs to the type I cytokine receptor family.

Type 3 subfamily. Contains 1 fibronectin type-III domain.

Contains 1 Ig-like C2-type (immunoglobulin-like) domain.
