<b>Product Detail:</b>	PDK1 (3 Phosphoinositide Dependent Protein Kinase 1) phosphorylates AGC kinases.

PDK1 activates conventional PKC and PKC zeta through phosphorylation of critical threonine residues in the activation loop. PDK1 also phosphorylates Protein Kinase B (PKB) at threonine 308 in the presence of phosphatidylinositol-3,4,5-trisphosphate. Active Akt inactivates Glycogen Synthase Kinase 3 (GSK3), eventually leading to the dephosphorylation and activation of glycogen synthase and the stimulation of glycogen synthesis. Because of the role that PDK plays in insulin-induced glycogen synthesis and PKC activation it is a potentially important target for metabolic drug research. There are three named isoforms.

**Function:**

Phosphorylates and activates not only PKB/AKT, but also PKA, PKC-zeta, RPS6KA1 and RPS6KB1. May play a general role in signaling processes and in development (By similarity). Isoform 3 is catalytically inactive.

**Subunit:**

Interacts with NPRL2.

**Subcellular Location:**

Cytoplasm. Membrane; Peripheral membrane protein. Note=Membrane-associated after cell stimulation leading to its translocation. Tyrosine phosphorylation seems to occur only at the plasma membrane.

**Tissue Specificity:**

Appears to be expressed ubiquitously.

**Post-translational modifications:**

Phosphorylated on tyrosine and serine/threonine. Phosphorylation on Ser-241 in the activation loop is required for full activity. PDK1 itself can autophosphorylate Ser-241, leading to its own activation.

**Similarity:**

Belongs to the protein kinase superfamily. AGC Ser/Thr protein kinase family. PDK1 subfamily.

Contains 1 PH domain.

Contains 1 protein kinase domain.

PDK1是蛋白激酶B(PKB)的上游激酶,通过与3,4,5三磷酸磷脂酰肌醇作用激活相邻的PKB分子.PDK1能够激活包含PKB在内的一系列的AGC激酶家族成员.从而调节细胞代谢,生长,扩散,生存,抗凋亡等诸多生理过程.
