Product Detail:	This gene encodes a transcriptional repressor that interacts with several members of the BCL2 family of proteins. Overexpression of this protein induces apoptosis, which can be suppressed by co-expression of BCL2 proteins. The protein localizes to dot-like structures throughout the nucleus, and redistributes to a zone near the nuclear envelope in cells undergoing apoptosis. Multiple transcript variants encoding different isoforms have been found for this gene.

Function:

Death-promoting transcriptional repressor.

Subunit:

Interacts with Bcl-2 related proteins, EMD, with the adenovirus E1B 19 kDa protein and with DNA.

Subcellular Location:

Cytoplasm. Nucleus.

Tissue Specificity:

Ubiquitous.

SWISS:

Q9NYF8

Gene ID:

9774
